Overview

1. Set bank balance
2. Add categories
3. Note payments/transactions
4. Set alerts for balance limits -> push notifications
5. Show diagrams
6. Show single diagram on the homepage
7. Get back tot he homepage from everywhere
8. Get into settings
9. Do settings/individualize the app

Set bank-balance

On the first use, the current bank balance has to be set in the app.

Therefore a button, called “Kontostand anpassen”, can be clicked.

With a click on that button, the user gets linked to a new page on which it is possible to insert a float number in a casket.

With another click on a “save” button, the user gets back to the start page on which the current bank balance will be shown.

Obviously, this method can be carried out after the first use as well - -whenever the bank balance differs from the inner app one.

Show diagrams

There is a possibility in the app to see several individual diagrams about the users financial state.

With the button “show diagram”, the system loads a new page. On that page, the user can select/click on the wished diagrams to be shown.

The System requests the needed data from the data bank and draws the clicked diagrams out of that information.
